BANTAY–BAHA: TECHNICAL DEMO SCRIPT (2:50)

About 300 words of narration at a calm pace (~140 words a minute), leaving time for the clicks and redraws. This is a feature-by-feature tour of the dashboard: every control, tab and column, and what it tells a health officer. **Anonymous:** no names, team name, school or logos on screen or in the voice-over. Record the dashboard full screen at 1920 x 1080, browser zoom 90%, with Typhoon Ompong selected and the track at "no shift" before you start. Cues in **bold** are what you click.

TIME	ON SCREEN	NARRATION
0:00-0:15	Dashboard, **Action map** tab. Slowly point down the sidebar: **Typhoon**, the two track sliders, **How to read this**.	"This is the Bantay-Baha dashboard. On the left you choose a typhoon and, if you want, move its track. Everything else updates from that choice."
0:15-0:35	Open the **Typhoon** box, type `Kalm`, then press Esc to keep Ompong. Point at the caption: 4 backtest typhoons, then the catalogue.	"Four typhoons have full what-if tracks. Every other storm from 2017 to 2020 that reached land is in the catalogue too, searchable by name: 42 storms in all, 98 scenarios."
0:35-0:55	**Colour provinces by**: click **Surge risk R**, then **Access loss A**, then back to **Priority P**. Hover the track, the dashed gale swath and a green ferry line.	"The map can colour provinces by surge risk, by access loss, or by priority, which is the two multiplied. On top: the track, the gale-force swath, and the 42 ferry routes this storm would cancel."
0:55-1:15	Right panel **Act first**: point at the top rows and the tier counts below (0 deploy, 22 pre-position). Hover the **Surge risk R** header to show its definition.	"Act first lists the top ten, each with an action tier: deploy clinics, pre-position supplies, or monitor. Every column header explains itself on hover. For Ompong, 22 provinces should pre-position supplies."
1:15-1:35	Sidebar: **Move track north or south** to **1° south**, wait for the redraw, then **Back to observed track**. Point at the browser address bar.	"Move the storm one degree south and the whole ranking updates in seconds; 58 ferries close instead of 42. The choice is kept in the link, so a colleague opening it sees the same scenario."
1:35-2:00	**Provinces** tab. Scroll right along Pampanga's row: R 0.83 and R raw 0.50, A range 4.8-6.4%, cases 934 (337-1,162), under-5 and 60+ cut off, Sentinel, Main drivers. Click **Download table (CSV)**.	"Provinces is the full ranked table. Pampanga's surge risk is 83 percent after calibration. Its access loss is shown as a range, because two methods measure it: a road-and-ferry network and a travel-time map. You get expected cases with a 90 percent range, children and older people cut off, and the main drivers of the risk. One click downloads it."

2:00-2:15	**Municipalities** tab: choose **Pampanga**. Point at Candaba (36%), Apalit, San Luis.	"Municipalities drills down to towns. In Pampanga, Candaba loses the most access, so that is where a mobile clinic should go."
2:15-2:35	**Outbreak graph** (sentinels), then **Forecast skill**: the model comparison, then **Weeks ahead** 4 for the fan chart. Then **Validation**.	"Outbreak graph shows which provinces rise first. Forecast skill compares our model with the baseline and three benchmarks, with every forecast's range. Validation shows whether high-priority provinces really surged, and how stable the ranking is."
2:35-2:50	**Leptospirosis** (lag chart), **Data & caveats**, then **Usability test**. End on the Action map.	"Leptospirosis shows how cases follow rain. Data and caveats lists every limit next to the numbers. And a built-in usability test lets health officers rate the tool."

NUMBERS ON SCREEN (OMPONG, OBSERVED TRACK; SAME AS THE DEMONSTRATION VIDEO)

- Act first: deploy 0, pre-position 22; 42 of 108 ferry routes cancelled; top priority Pampanga.
- Pampanga: R 0.83 calibrated (R raw 0.50), A 4.8% (method range 4.8-6.4%), cases next 4 weeks 934 (90% range 337-1,162).
- Municipalities, Pampanga: Candaba 36% cut off, then Apalit 28%, San Luis 25%.
- 1° south: 58 ferry routes cancelled. Catalogue: 42 storms scored (4 backtest typhoons + 38 others), 98 scenarios.
- Calibration makes ties: nine provinces share R 0.83 for Ompong, so the map ranks by P, not by R alone.

BEFORE RECORDING

- Tabs, in order: Action map, Risk vs access, Provinces, Municipalities, Outbreak graph, Forecast skill, Leptospirosis, Validation, Data & caveats, Usability test.
- Do not type anything into the Usability test form during the take; only show it.
- Hide the browser bookmarks bar and any tabs or accounts that show a name; the address bar may show only `localhost`.
- Keep the mouse still while you speak over a chart, and move it only on the cues. Trim to 2:50 in editing.
